# **GALAXY**

**Fridge magnet gift**

Elliptical galaxies are so bright that if Earth were located inside of one, there would always be day light everywhere no matter the time of day.

Elliptical galaxies often appear to have one bright star in the middle but it is actually a collection of stars.

Four galaxies can be seen from Earth with the naked eye: the Milky Way, the Andromeda Galaxy, and the Small and Large Magellanic Clouds.

Our galaxy, the Milky Way, is a spiral galaxy.

Small galaxies contain less than a billion stars.
